"GAME DESCRIPTION" IS NOT AVAILABLE AT THIS TIME.

GENERAL INSTRUCTIONS

FOR

POWER DRIVE - 3 PLAYER - U. R.

INSTALLATION

1. Remove keys from the taped coin return slot and unlock to open the coin box door.
2. Remove four (4) "CABINET LEVELING LEGS" from inside the coin box.
3. Tip the cabinet to the side and remove the shipping cleats from its bottom.
 - Locate the threaded holes - one in each corner - and install the "CABINET LEVELING LEGS" in them.
 - Level the cabinet.
 - When finished, the cabinet should be stable in the upright position.
4.
 - Unlock and remove the rear access door to gain access to the 3-pronged line cord. Reinstall the rear access door.
5. Connect the 3-pronged line cord to a 3-slot A.C. wall outlet to insure proper grounding.
6. The power ON/OFF switch is located:
UPRIGHT MODEL: On top to the right rear of the cabinet as you face the cabinet.

TO SERVICE THE CONTROL PANEL

1. UPRIGHT MODEL:
 - Turn power to the game off.
 - The control panel is held in place by two (2) latch clamps which provide constant pressure on the strikes.
 - They can be reached through the coin door.
 - To release the clamps, lift up and toward the center of the control panel.
 - Once they are released, unhook them from their strikes.
 - Swing out the control panel on it's hinge against the cabinet front for servicing.
 - To resecure the control panel, reverse this procedure.

NOTE: To remove the control panel for bench-servicing only:

- With the control panel in it's open position, disconnect it from it's cabling.
- Remove the screws which secure the continuous hinge to the cabinet.
- The control panel is now loose and may be bench serviced.
- To reinstall the control panel, reverse this procedure.

REMOVAL OF THE VIEWING GLASS

1. UPRIGHT MODEL:

NOTE: To accomplish this, the hinged control panel MUST swing open to rest against the cabinet front. See the "TO SERVICE THE CONTROL PANEL-UPRIGHT MODEL" procedure.

- Turn power to the game off and swing open the hinged control panel. This frees the viewing glass so it can be removed.

- By putting your fingers in the slot in the middle of the main-display-glass support, the viewing glass can be removed as follows:
 - 1) Lift the glass up.
 - 2) Swing the bottom edge of the glass out slightly forward.
 - 3) Drop the glass down so that its' top edge is slightly below the bottom edge of the speaker grille.
 - 4) Now, holding the glass by its' top edge and bottom edge, lift up and out.
- To reinstall the viewing glass, reverse this procedure.

REMOVAL OF THE HEADER (ATTRACT) GLASS AND/OR THE FLUORESCENT LIGHT ASSEMBLY AND/OR THE SPEAKER(S)

1. UPRIGHT MODEL:

- Turn the power to the game off.
- Removal of the header (attract) glass:
 The glass is held in place by the speaker grille at the bottom and a retaining bracket at the top.
 The retaining bracket is secured to the cabinet top by five tamper-resistant screws. Remove these screws by using a special wrench provided in the Hardware and Bag Assembly.
 Remove the retaining bracket and slide up the header glass. This exposes the fluorescent light assembly.
 The fluorescent light tube may be replaced at this time.
 * **WARNING: If you drop a fluorescent tube and it breaks, IT WILL IMplode!**
 Use care in handling.
 To reinstall the header glass, reverse this procedure.
- Removal of the fluorescent light assembly (see picture on page 2-9):
 Be sure the power to the game has been turned off.
 Disconnect it from it's power cable.
 Remove the fluorescent light assembly's three mounting screws and then remove the assembly from the cabinet.
 To reinstall the fluorescent light assembly, reverse this procedure.
- Removal of the speaker(s):
 Be sure the power to the game has been turned off.
 Remove the header glass and disconnect cabling from the speaker(s).
NOTE: To remove one or both speakers, it is NOT required to remove the speaker grille.
 The grille is held to the cabinet with tamper-resistant screws. Each speaker is secured to the wooden speaker panel by two carriage bolts and two nuts. Remove the speaker(s) by removing the nuts and sliding the bolts out of the grille.
 To reinstall the speaker(s), reverse this procedure.

VOLUME CONTROL POT / OPTION SWITCH LOCATIONS

The volume control pot is located, along with the credit switch and the self-test switch, just inside the cabinet on the right side of the coin door frame. The option switch is located as shown in the attached Monoboard reference drawing. For adjustment, it can be reached through the game's rear access door.

To make the sounds louder, turn the volume pot clockwise as you face it.

To make the sounds less loud, turn the volume pot counterclockwise as you face it.

SELF-TEST MODE

The Self-Test mode is a special mode for checking the game switches and computer functions. It is the most complete way of checking for proper game operation and is quite easy to use.

The Self-Test mode may be entered at any time and from any mode of operation. Simply locate the black slide switch inside the Coin Box compartment and slide it to the Self-Test position. With this switch in the Self-Test position, activate the slam switch located on the Coin Door. The game will enter the Self-Test mode immediately and display the following test menu....

1. INPUT TEST
2. OUTPUT TEST
3. DIPSWITCH OPTIONS
4. SELF-DIAGNOSTICS
5. GRID TEST

TO MOVE CURSOR UP, PRESS LEFT WHEEL BUTTON OF LEFT, MIDDLE, OR RIGHT SET.
TO MOVE CURSOR DOWN, PRESS RIGHT WHEEL BUTTON OF LEFT, MIDDLE, OR RIGHT SET.
TO EXECUTE TEST, PRESS ANY "WHEELIE" BUTTON.

1. INPUT TEST: This test is designed to confirm the operation of player input switches and device switches in the game. When you enter the test, the screen displays the following:

WHEELIE 1	OPEN	WHEELIE 3	OPEN
SHIFT 1	OPEN = 2WD	SHIFT 3	OPEN = 2WD
LEFT WHEEL 1	OPEN	LEFT WHEEL 3	OPEN
RIGHT WHEEL 1	OPEN	RIGHT WHEEL 3	OPEN
WHEELIE 2	OPEN	COIN CHUTE 1	OPEN
SHIFT 2	OPEN = 2WD	COIN CHUTE 2	OPEN
LEFT WHEEL 2	OPEN	COIN CHUTE 3	OPEN
RIGHT WHEEL 2	OPEN		
		CREDIT BUTTON	OPEN

When you activate any one of the above switches, its' respective message "OPEN" changes to "CLOSED" except for SHIFT 1, SHIFT 2, or SHIFT 3. For any one of these three, when the shift lever is down, "OPEN = 2WD" appears on the screen (switch de-activated). The shift lever is now in 2 wheel drive. When the shift lever is up, "CLOSED = 4WD" appears on the screen (switch activated). The shift lever is now in 4 wheel drive. To exit this test, activate the coin door slam switch.

2. OUTPUT TEST: This test is designed to confirm the operation of all 3 players' Wheel button lights will flash in sequence with the following messages displayed on the screen:

PLAYER 1	LIGHT ON
PLAYER 1	LIGHT OFF
PLAYER 2	LIGHT ON
PLAYER 2	LIGHT OFF
PLAYER 3	LIGHT ON
PLAYER 3	LIGHT OFF

This cycle continues unless:

- A. You press any one of the Wheel buttons to hold a light ON.
- B. You exit the test by activating the coin door slam switch.

- 3. DIPSWITCH OPTIONS: This test displays, on the screen, the current status of dip switch settings. To exit this test, activate the coin door slam switch.
- 4. SELF-DIAGNOSTIC TEST: For this test only, press any Wheel button to run diagnostics. If at the end of the run, the message "ALL TEST OK" is displayed on the screen then the test is successful. If this message is not displayed, there exists a diagnostics problem. A test of the Sound Board interface is included in the run. To exit the test, activate the coin door slam switch.
- 5. GRID DISPLAY: This test was designed to display a crosshatch pattern used in adjusting the color monitor. This pattern may be used to adjust convergence, color balance, vertical linearity, and vertical/horizontal size. To exit this test, activate the coin door slam switch.

NOTE: One Sound Test available with this game is when activating any of the Wheel buttons (e.g. when moving the cursor along the test menu) and when activating the coin door slam switch.

IMPORTANT NOTE: There is NO battery back up provided for this game. All logic & memory functions will be retained thru dip switch settings.

P.C. BOARD REFERENCE DRAWING

FOR MONOBOARD SYSTEM

INTRODUCTION

This manual offers generalized troubleshooting procedures for common types of malfunctions which can be applied to most video games. We will not attempt to give you specific instructions for troubleshooting particular games because this would involve hundreds of pages of more repetitive instructions, differing only in the specific details of each game.

The most common problems occur in harness components such as the coin acceptor, player controls, interconnecting wiring, etc. These areas are covered in moderate detail.

The TV Monitor and Game Logic Printed Circuit Boards (PCB's) provide their fair share of problems too, but not to the extent of the harness and its component parts.

As you already know, the Game Logic PC Boards are complex devices. Each contains a great number of different interrelated circuits. The major changes which give each game its own particular individuality are accomplished in the EPROMS and other Integrated Circuit devices that are installed on each of these PC Boards.

GENERAL TROUBLE SHOOTING SUGGESTIONS

The first step in troubleshooting is to correctly identify the malfunctions symptoms. This includes not only the circuits or features malfunctioning, but also those still operational. A carefully trained eye will pick up other clues to what's wrong as well. For instance, a game in which the computer functions fail completely just after money was collected may have a quarter shorting the PCB traces. Often an experienced troubleshooter will be able to spot the cause of a problem even before opening the cabinet.

After all the clues are carefully considered, the possible malfunctioning areas can be narrowed down to one or two good suspects. Those areas can be examined by a process of elimination until the cause of the malfunction is discovered.

HARNESS COMPONENT TROUBLESHOOTING

Typical problems falling in this category are coin and credit problems, power problems, and failure of individual features.

NO GAME CREDIT - - For example, a prospective game player inserts a quarter or token and is not awarded a game. The first thing to check is whether or not the quarter or token is returned. If it was returned, the malfunction most certainly lies in the coin acceptor itself. First, use a set of test coins (both old and new) to ascertain that the player's coin is not undersize or underweight. If your test coins are also returned, coin acceptor servicing is indicated. Generally, the cause of this particular problem is a maladjusted magnet gate. Normally, this will mean slightly closing the magnet gate by turning the adjusting screw out a bit.

If the quarter or token is not returned and there is no game credit, the cause of the malfunction may be in one of several areas. First, try operating the coin return button; if the coin is returned, the problem is most likely in the magnet gate. Enlarge the gap according to the coin acceptor manufacturers service procedures. If this does not cure the problem, remove the coin acceptor, clean it, and perform the manufacturers suggested major adjustment procedure.

If the trapped coin is not returned when the wiper lever is actuated, you may have an acceptor jammed by a slug, gummed up with beer, a jammed coin chute, or mechanical failure of the acceptor mechanism. In this case, first check for the slug that will generally be trapped against the magnet. If a slug is found, simply remove it and test the acceptor. If the chute is blocked, remove the acceptor and remove the jammed coins. If there is actual failure of the acceptor, remove the unit and repair as indicated by the acceptor manufacturers service procedures.

If the coin is making its way through the acceptor (that is, falling into the coin box), yet there is still no game credit, you either have a mechanical failure of the coin switch or electrical failure of the coin and credit circuits. The first place to begin is by checking the coin switch. Most of these switches are the make/break variety of micro switch. They are checked for continuity between the "NO", "NC", and "C" terminals. When not actuated, the "NC" and "C" terminals should be continuous and the "NO" terminal open. When actuated, the "NO" and "C" terminals should be continuous and the "NC" terminal open. If the coin switch checks good, inspect the solder connections to the coin switch terminals to be sure there is good contact at this point. If necessary, use a continuity tester and check from the terminal lug on the switch to the associated PCB trace. This will tell you if there is a continuous line all the way to the credit circuit.

If the coin switch wires do check good, the problem is in one of the game logic boards - most likely in the coin and credit circuitry.

If you do get a game credit when a coin is deposited, but the game will not start when the one or two player start button is pressed, there may be a problem in the start switch, the interconnecting wiring, or the game logic boards. First, check the switch. If the switch is OK, proceed to check the wiring. Again, make sure you go from the terminal lug on the switch to the PCB trace. This way, you will check the terminal contact as well as the PCB edge connector contact. If the wiring is continuous, proceed to check the PCB credit circuit. If not, check each section of the wiring, until the discontinuity is located. If the wiring is OK, the problem must lie in the games logic boards.

TRANSFORMER AND LINE VOLTAGE PROBLEMS

Your game **MUST** have the correct line voltage to operate properly. If the line voltage drops too low, one of the games logic circuits will disable the credit acceptance circuit. The point at which the games logic circuits will fail to function is approximately 105 volts AC.

Low line voltage may have many causes. Line voltage normally fluctuates a certain amount during the day as the total usage varies. Peak usage times occur mainly at dawn and/or dusk. So if your games problem seems to be related to the time of day, this may be a factor. A large load connected to the same line as the game (such as a large air conditioner or other device with an exceptionally large electric motor) may drop the line voltage significantly when starting up. This drop can result in an intermittent credit problem. In addition, poor connections in the location wiring, plug, or line cord may also cause a significant drop in power. Cold solder joints in the games harness, especially in areas like the transformer connections, interlock switch, or fuse block, may also produce the same results, although probably on a more permanent basis.

Sometimes location owners (especially in bars) replace light switches with dimmer rheostats, and the game is sometimes on the same line. Obviously, the voltage available to the game is going to drop dramatically when the dimmer is turned down.

In any case, the way to check for proper line voltage is with your VOM. Set the VOM to the 250 VAC scale and stick the probes into the wall outlet the game was connected to. If it's OK here, check the transformer primary connections. If you do not get 117 VAC, examine the solder joints on the transformer, fuse block, and interlock switch. If you do get 117 VAC, the problem must be either in the transformer, harness connections, or in the PCB power supply.

If you suspect the transformer, check its secondaries with the VOM set to the 50 VAC scale and correlate the readings with the legend on the side of the transformer. The transformer must also be correctly grounded, so check the ground potential as well, especially if there is a hum bar rolling up or down the Monitor screen.

NO POWER, NO PICTURE - - If the Monitor screen is completely dark, first look in back of the Monitor to see if the CRT filament is glowing. If it is, try adjusting the brightness control. If no luck here, put your ear near the Monitor and listen for the high-pitched B+ hum produced by the flyback transformer. If you get the hum but no picture, and you have tried adjusting the brightness, major Monitor servicing is indicated.

If the monitor seems completely dead, check the rest of the game to see if it has power. If it doesn't, go directly to the wall outlet and check there. If OK there, check the game fuse(s), interlock switch, and interconnecting wire lengths.

Sometimes it is difficult to tell if a slow-blow fuse has blown. If in doubt, check it using any of the VOM "R" scales.

HARNESS PROBLEMS - - Other harness problems include blowing fuses and malfunctioning controls. The repeating blown-fuse problem can sometimes be quite exasperating to solve. Short circuits have the tendency to occur in areas almost impossible to find. First, try inserting a new fuse as old fuses age and sometimes blow without cause. If the new fuse also blows, you definitely have a short.

The best way to approach this problem is by disconnecting devices that may be causing the problem, such as the TV Monitor, the various PCB's one at a time, and the isolation transformer. Disconnect the devices by FIRST turning the game off, disconnecting it from its wall outlet. Remove the blown fuse and connect your VOM across the terminals of the fuse block (this will save blowing a fuse each time you want to check the circuit). Set your VOM to one of its resistance scales. You should be reading a short. If not you probably have a part that only shorts out after it is heated up - we'll cover this in a minute. So, assuming you are reading a short on your VOM, disconnect the components from their cabling one at a time, checking the VOM after each one is disconnected. When the short disappears, you have just disconnected the bad component. If all components are disconnected and the short still remains, the problem is in the harness and only patient exploration will reveal its location. Carefully examine all the wiring, looking for terminals that may be touching, metal objects such as coins shorting the connections, or burned insulation. If necessary, use the VOM to check each suspected wire.

OK, now lets assume that you connected your VOM across the fuse block terminals as stated above and you did not read a short. This most likely means that you have a component somewhere in that game that **ONLY** goes bad **AFTER** it heats up. It checks good when its cold. In this case, turn the game off and disconnect **ALL** of its components. Install a known good fuse in the fuse block. And turn the game on. If the fuse does not blow after a few minutes, you know that it is not anything to do with the wire harness. (In this instance, it shouldn't be, actually. But it never hurts to check.) Next, turn the game off again and reconnect **ONE** component. Turn the game back on and wait a few minutes to see if the fuse blows. If it does not, turn the game off again and reconnect another single component.

Turn the game back on and wait a few minutes to see if the fuse blows. Repeat this procedure until the fuse blows. When it does blow, the last component you connected has the part on it that is going bad after it warms up and is shorting out.

MALFUNCTIONING CONTROLS - - The most common problem here is the bad potentiometer (pot). Typically, a bad pot will cause the image on the screen to jump when it reaches a certain point. The only cure for this one is to install a new pot.

If a feature that is operated by a switch (for example, joysticks, foot pedals, control panel buttons) does not operate at all, check the switch with a VOM or continuity tester to verify its operation. If the switch does not check good, replace it. If the switch is OK, you should suspect the input to the switch from the PCB. In this case, get out the harness and logic schematics and check to see what kind of input is supposed to be at this switch. In many cases, the input will be +5 volts DC. If so, use the VOM to check its presence with the game turned on. Normally, the switch is used to pull a +5 volt DC line LOW to GROUND or to pull a LOW line HIGH. If the PCB output is missing, check the wire length from the PCB. If you find the signal at the PCB trace, the wire length or connection is at fault. If there is no signal at the PCB trace, begin exploring the PCB using the logic schematics and game manual.

HEADER FLUORESCENT LIGHT ASSY.-PARTS LIST
 PART NO. A595-00011-0000

ORDER BY PART NUMBER ONLY

ITEM	PART NO.	DESCRIPTION
1	0595-00105-0000	FLUORESCENT BRKT.
2	0017-00003-0043	18" COOL WHITE FLUORESCENT LAMP
3	0017-00003-0445	LAMP LOCKS (2 REQ'D.)
4	0017-00031-0036	FLUORESCENT SOCKET (2 REQ'D.)
5	0017-00003-0412	FLUORESCENT STARTER HOLDER W/LEADS
	0017-00101-0347	#6-32 X 1/2 PHIL. RND. HD. M.S. (4 REQ'D.)
6	0017-00003-0019	FLUORESCENT STARTER
7	0017-00003-0026	BALLAST
	0017-00101-0598	#8-32 X 5/16 SLT. HEX HD. SCR. (4 REQ'D.)

CONTROL SHELF ASSEMBLY
PART NO. AE68-00004-0000

CONTROL SHELF ASSEMBLY - PARTS LIST
PART NO. AE68-00004-0000

ORDER BY PART NUMBER ONLY

ITEM	PART NO.	DESCRIPTION
1	AE36-00010-00XF	CONTROL - APRON WELD ASSY.
2	AE68-00005-0000	CONTROL SHELF CABLE ASSY.
	AE68-00014-0000	CONTROL PLATE ASSY. (INCLUDES ITEMS 3 THRU 19)
3	AB96-00012-0000	BALL-KNOB & HANDLE ASSY. (3 REQ'D.)
	OB96-00703-00XF	HANDLE (3 REQ'D.)
	OB96-00901-0000	BALL-KNOB: BLACK/ROUND (3 REQ'D.)
	AB96-00016-0000	2-WAY SPEED SHIFT (3 REQ'D.) (INCLUDES ITEMS 4 THRU 10)
4	AB96-00010-0000	YOKE MTG. & PLATE ASSY. (3 REQ'D.)
5	AB96-00013-0000	BRKT. & SWITCH ASSY. (3 REQ'D.)
	AB96-00014-0000	SWITCH ASSY. (3 REQ'D.)
	OB96-00108-0000	BRKT.: SWITCH (3 REQ'.D)
	0017-00101-0528	5-40 X 12 PHILLIPS RND MACHINE SCREW (6 REQ'D.)
6	AB96-00018-0000	YOKE ASSY. & BEARINGS (3 REQ'D.)
7	OB96-00704-00XF	PIVOT: SPRING (3 REQ'D.)
8	0010-00227-0000	SPRING: TORSION (6 REQ'D.)
9	0017-00041-0616	BUMPER: RUBBER, NEOPRENE (6 REQ'D.)
10	0852-00701-00XF	PIN: PIVOT (3 REQ'D.)

19" COLOR MONITOR SCHEMATIC DIAGRAM

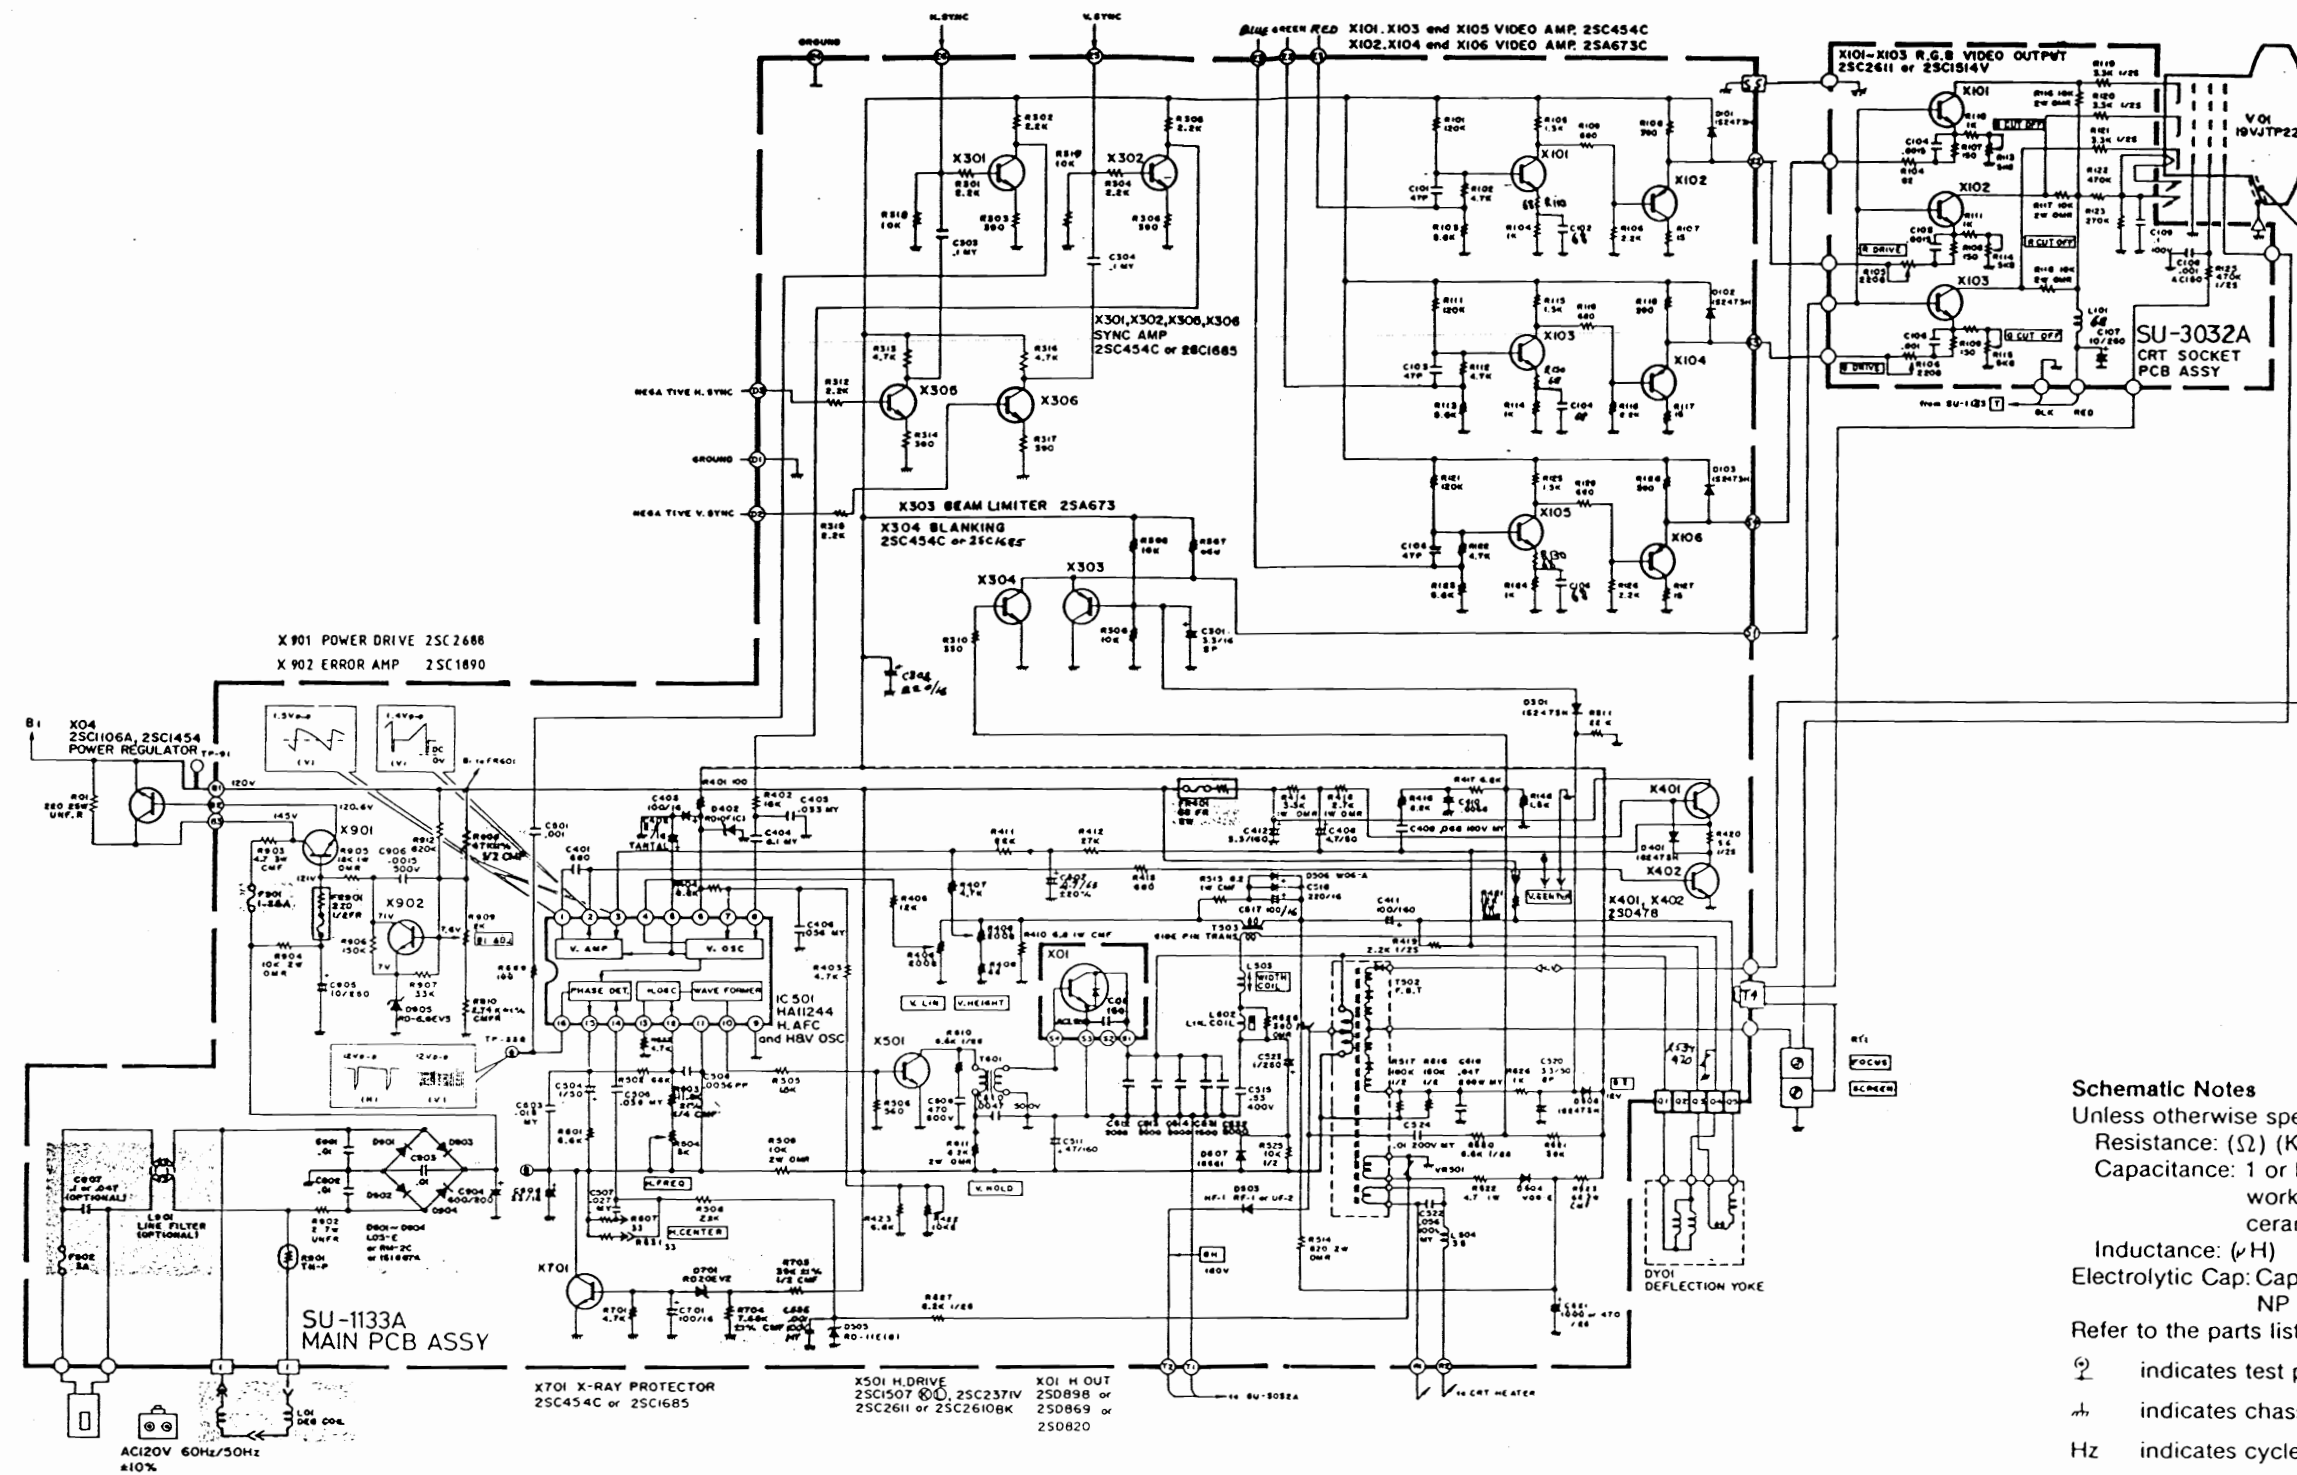

- NOTES
1. ALL RESISTORS ARE IN OHMS, 1/4W, 5% UNLESS OTHERWISE INDICATED.
 2. CAPACITANCE VALUES LESS THAN 1 ARE IN MICROFARADS, ABOVE 1 IN PICOFARADS UNLESS OTHERWISE INDICATED.

⚠ CAUTION SAFETY CRITICAL COMPONENT.
 ★ X-RAY RADIATION RELATED COMPONENT.
 REPLACE ONLY WITH SAME TYPE PARTS AS SHOWN IN PARTS LIST.

Schematic Notes
 Unless otherwise specified
 Resistance: (Ω) (K \rightarrow K Ω , M \rightarrow M Ω), 1/4 (W) carbon resistor
 Capacitance: 1 or higher \rightarrow (pF), less than 1 \rightarrow (μ F)
 working voltage \rightarrow 50 (V)
 ceramic capacitor
 Inductance: (μ H)
 Electrolytic Cap: Capacitance Value (μ F)/working voltage (V).
 NP \rightarrow non-polar (or bipolar) electrolytic cap.
 Refer to the parts list for additional component information.
 P indicates test point connection
 ch indicates chassis ground unless otherwise specified
 Hz indicates cycles per second
 For **safety** purposes (and continuing reliability)
 Δ replace all components marked with safety symbol with identical type.
 NOTE: FR \rightarrow fusible resistor

00-4147-04
 G07-CB0

Parts identification on circuit boards:
 e.g. SU1126A (R107 = R1107)
 SU3030A (R113 = R3113)

REPLACEMENT PARTS LIST—ELECTROHOME 19" MONITOR

Components identified by the Δ symbol in the PARTS LIST and on the Schematic have special characteristics important to safety.

DO NOT degrade the safety of the set through improper servicing.

Abbreviations for Resistors and Capacitors

Resistor		Capacitor	
C R	: Carbon Resistor	C Cap.	: Ceramic Capacitor
Comp. R	: Composition Resistor	M Cap.	: Mylar Capacitor
OM R	: Oxide Metal Film Resistor	E Cap.	: Electrolytic Capacitor
V R	: Variable Resistor	BP E Cap.	: Bi-Polar (or Non-Polar) Electrolytic Capacitor
MF R	: Metal Film Resistor	MM Cap.	: Metalized Mylar Capacitor
CMF R	: Coating Metal Film Resistor	PP Cap.	: Polypropylene Capacitor
UNF R	: Nonflammable Resistor	MPP Cap.	: Metalized PP Capacitor
F R	: Fusible Resistor	PS Cap.	: Polystyrol Capacitor
		Tan. Cap.	: Tantal Capacitor

NOTE: When ordering replacement parts please specify the part number as shown in this list including part name, and model number. Complete information will help expedite the order.

Use of substitute replacement parts which do not have the same safety characteristics as specified, may create shock, fire or other hazards. For maximum reliability and performance, all parts should be replaced by those having identical specifications.
